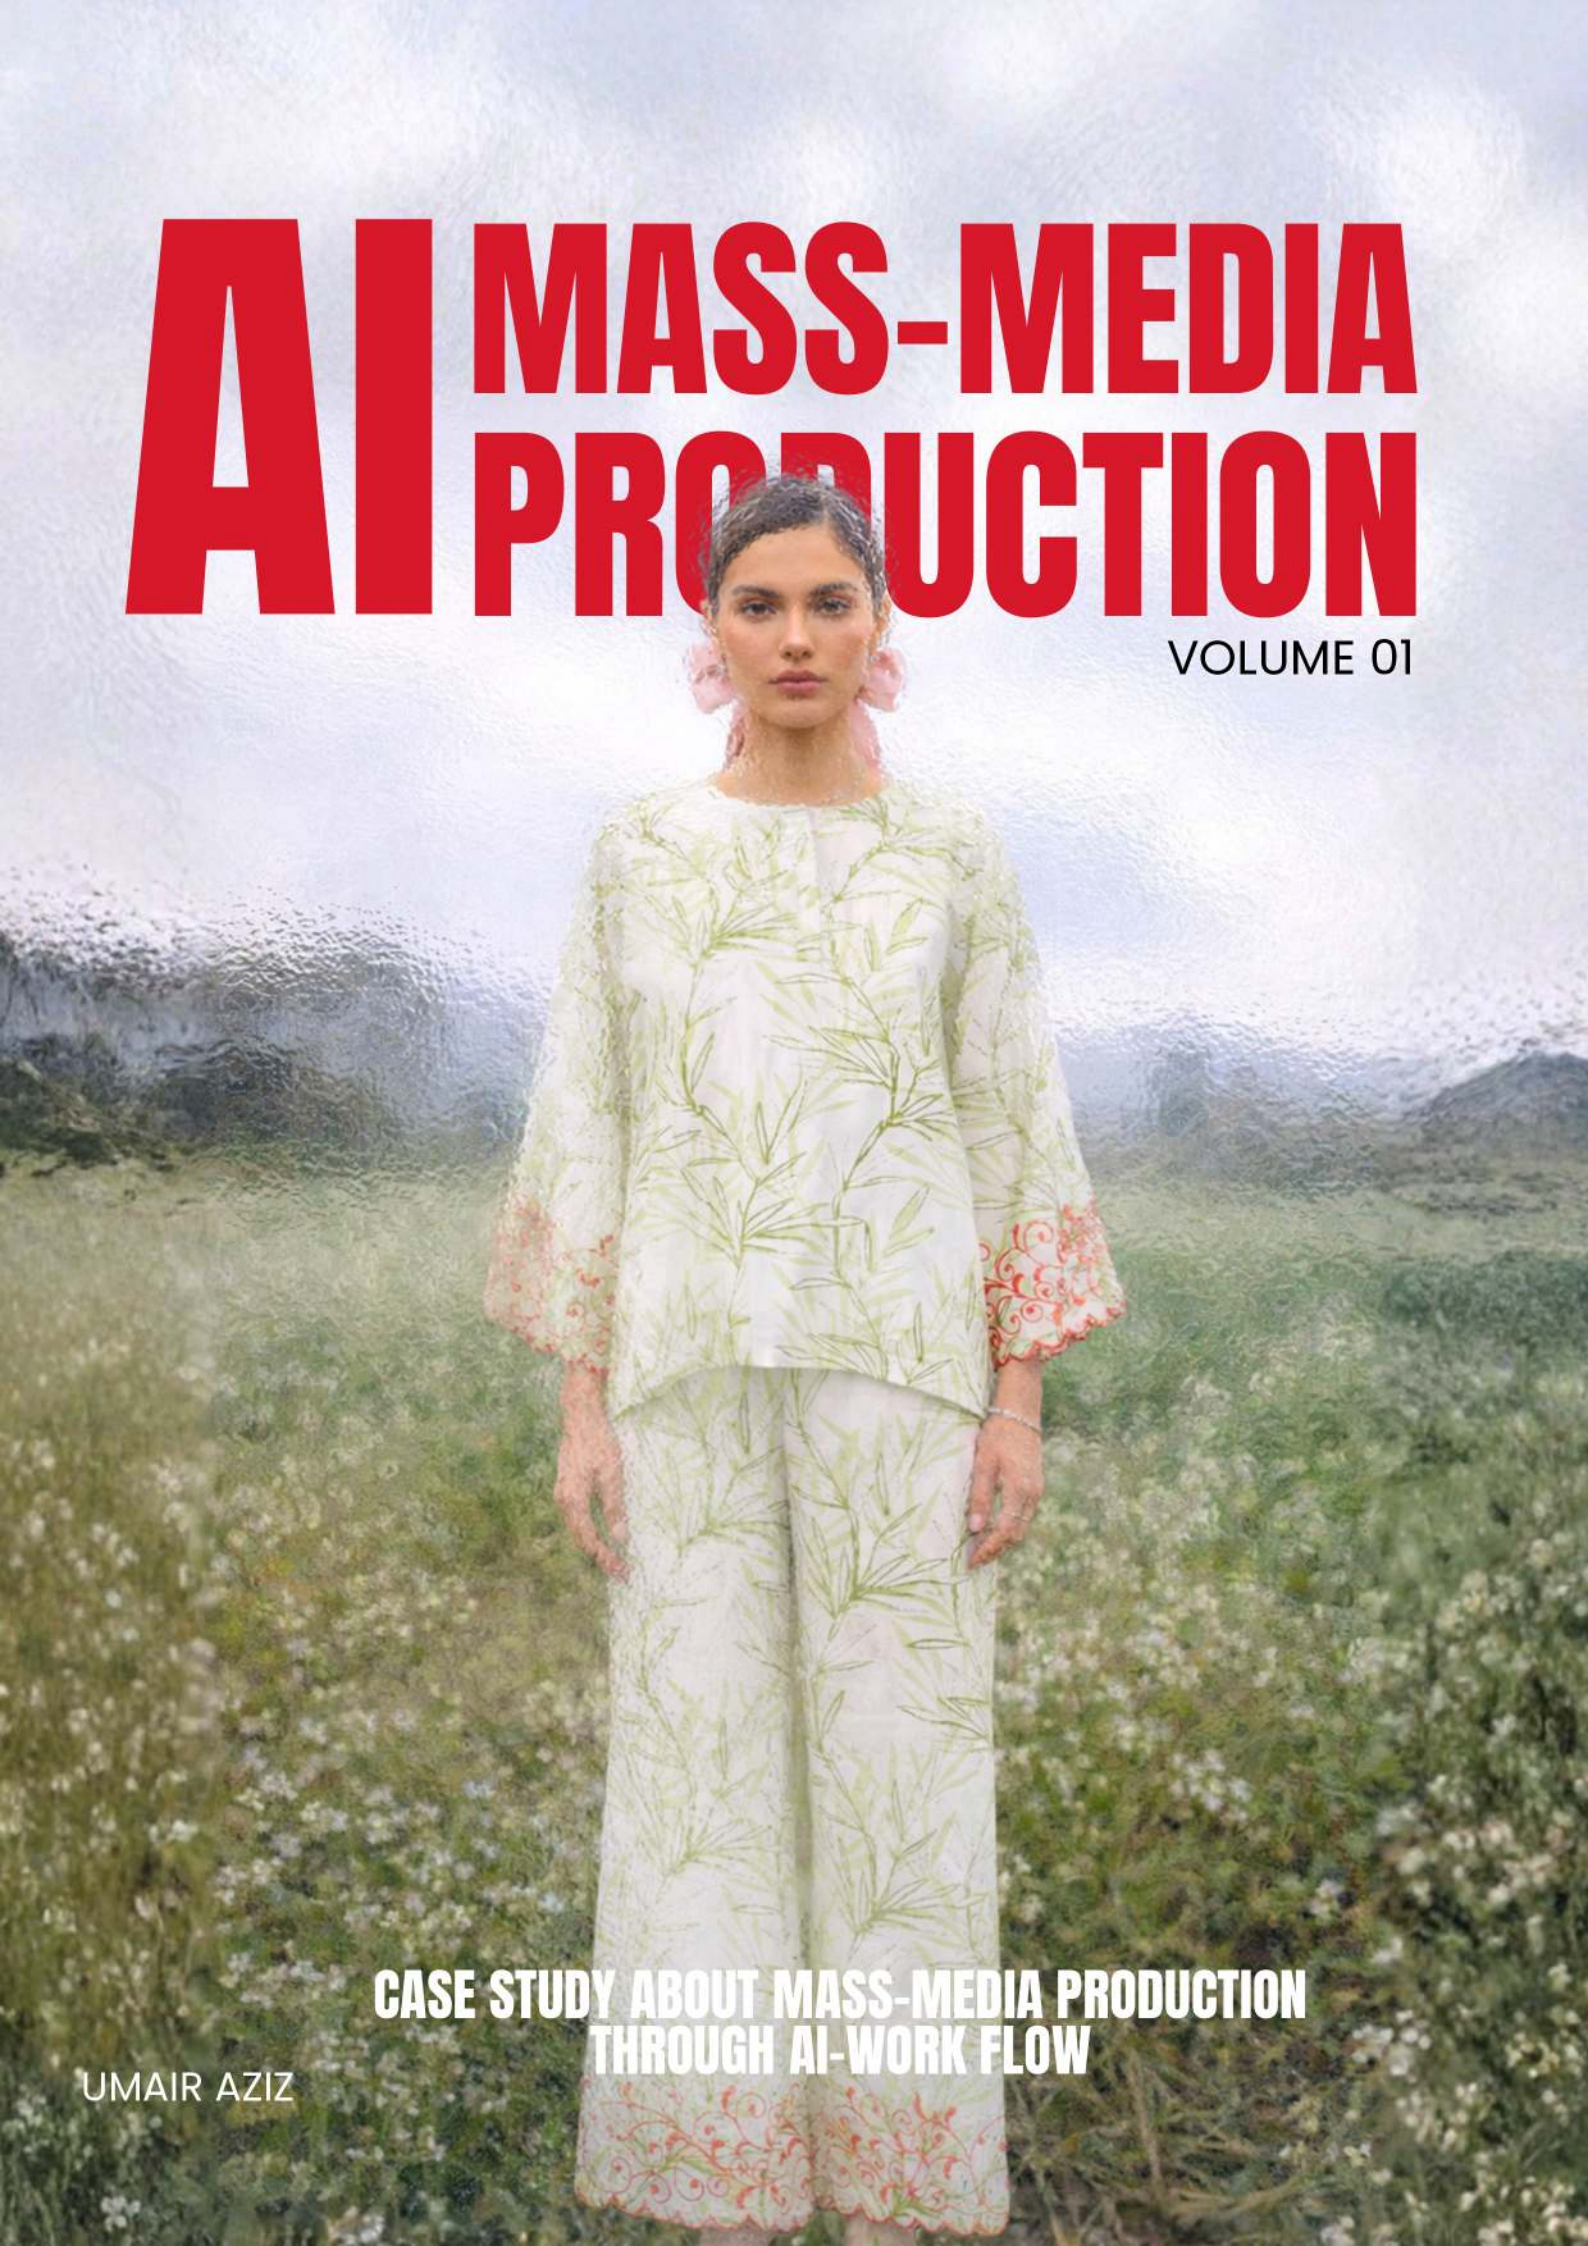
AI MASS-MEDIA PRODUCTION

VOLUME 01



CASE STUDY ABOUT MASS-MEDIA PRODUCTION THROUGH AI-WORK FLOW

UMAIR AZIZ

INTRODUCTION

Overview

Zellbury required high-quality lifestyle imagery for 300+ apparel articles across Men's, Women's, and Kids categories. However, the available assets consisted only of raw mannequin photography of the garments.

Traditional solutions would require:

- hiring models
- studio production
- styling
- lighting
- location shoots
- post-production

This process would have been time-consuming and expensive at scale.

I developed an AI-powered production workflow to transform mannequin photography into fully styled model-based product imagery suitable for e-commerce.

THE CHALLENGE

Zellbury had:

- Raw garment photos on mannequins
- No model photography
- No lifestyle shots
- Hundreds of SKUs to process

For e-commerce, mannequin images often lack emotional appeal and visual engagement, which can negatively affect conversion rates.

The goal was to:

- convert mannequin garments into realistic model imagery
- maintain exact garment accuracy
- scale production to hundreds of product

THE SOLUTION

I designed a custom AI workflow using a custom AI Workflow to generate realistic fashion photography

The system reconstructs full fashion imagery by combining multiple references.

Input Assets

Each product uses multiple references:

- mannequin product image
- garment close-up details
- model identity reference
- footwear references
- accessories (earrings, hands etc.)
- environment/background references

These elements are processed through a structured AI node workflow to ensure accuracy.

AI WORKFLOW ARCHITECTURE

The workflow reconstructs the entire fashion image while maintaining strict product accuracy.

Step 1 — Garment Reconstruction

The AI recreates the garment exactly as photographed on the mannequin.
Critical details preserved:

- fabric texture
- embroidery
- neckline design
- sleeve detailing
- print patterns
- borders and trims

This ensures the product remains visually accurate for e-commerce.

STEP 2 – MODEL INTEGRATION

A consistent model identity is applied to the generated imagery.
The AI preserves:
- facial structure
- skin tone
- body proportions
- hairstyle

This ensures brand consistency across product pages.

STEP 3 – STYLING & ACCESSORIES

Additional styling elements are integrated:
- footwear
- earrings
- hand positioning
- dupatta draping

These help simulate a real fashion shoot environment.

STEP 4 – ENVIRONMENT GENERATION

A controlled background is generated based on brand style.

Example elements:
- architectural wall niches
- soft studio lighting
- neutral color palettes

The goal is to create imagery that looks like professional commercial photography.

QUALITY CONTROL LAYER

To maintain product accuracy, strict constraints are applied to prompts:
Garment Accuracy (Critical)
AI is instructed to never modify:
- fabric patterns
- embroidery
- silhouette
- color tones
- garment length

This ensures the generated images remain true to the original product.

PRODUCTION PIPELINE

The workflow allows me to generate multiple image formats for each product.
Examples:
- full model shot
- zoomed editorial shot
- garment detail shot
- alternate pose

These assets are optimized for website product pages.

RESULTS

The AI workflow enabled Zellbury to scale visual production dramatically.

Production Scale

- 300+ products processed
- Multiple images per product

Key Benefits

Speed

Traditional shoots could take weeks.
AI generation reduces this to minutes per product.

Cost Efficiency

Eliminates:
· model fees
· studio rental
· styling costs
· logistics

Consistencyy

All images follow a uniform brand aesthetic

Scalability

The same workflow can process thousands of SKUs.

IMPACT FOR E-COMMERCE

AI-generated model imagery improves:
- product visualization
- customer engagement
- perceived brand quality
- conversion potential

It transforms static mannequin photography into lifestyle-driven product imagery.

TECHNOLOGY STACK

- Custom AI Space Workflow
- Custom prompt engineering
- Structured node workflow
- Reference-based image generation

KEY TAKEAWAY

I successfully built a scalable AI production system that converts mannequin photography into high-quality fashion imagery at scale, enabling Zellbury to efficiently populate its website with visually engaging product content.
